#### **NEW QUESTION: 1**

You performed an incremental level 0 backup of a database:

```
RMAN > BACKUP INCREMENTAL LEVEL 0 DATABASE;
```

To enable block change tracking after the incremental level 0 backup, you issued this command:

```
SQL > ALTER DATABASE ENABLE BLOCK CHANGE TRACKING USING FILE  
' /mydir/rman_change_track.f';
```

To perform an incremental level 1 cumulative backup, you issued this command:

```
RMAN> BACKUP INCREMENTAL LEVEL 1 CUMULATIVE DATABASE;
```

Which three statements are true?

- A.** More than one database block may be read by an incremental backup for a change made to a single block.
- B.** The change tracking file must always be backed up when you perform a full database backup.
- C.** Backup change tracking will sometimes reduce I/O performed during cumulative incremental backups.
- D.** Block change tracking will always reduce I/O performed during cumulative incremental backups.
- E.** The incremental level 1 backup that immediately follows the enabling of block change tracking will not read the change tracking file to discover changed blocks.

**Answer: A,C,E**

Explanation:

A: In a cumulative level 1 backup, RMAN backs up all the blocks used since the most recent level 0 incremental backup.

E: Oracle Block Change Tracking Once enabled; this new 10g feature records the modified since last backup and stores the log of it in a block change tracking file using the CTW (Change Tracking Writer) process. During backups RMAN uses the log file to identify the specific blocks that must be backed up. This improves RMAN's performance as it does not have to scan whole datafiles to detect changed blocks. Logging of changed blocks is performed by the CTRW

process which is also responsible for writing data to the block change tracking file. Note:

\* An incremental level 0 backup backs up all blocks that have ever been in use in this database.

### **NEW QUESTION: 2**

Which two statements are true regarding a PL/SQL package body? (Choose two.)

- A.** It can contain only the subprograms defined in the package specification.
- B.** It can be changed and recompiled without making the package specification invalid.
- C.** It cannot invoke subprograms defined in other packages.
- D.** It cannot be created without a package specification.

**Answer: B,D**

Explanation:

Package Specification and Body

Package bodies:

Are separate from package specifications. Because of this, the code of the body can be changed and recompiled, and other objects that are dependent on the specification are not marked invalid.

Contain the code for subprograms defined in the package specification. This is where the work is done. The specification shows how to call subprograms within the package: the body is the code section

Cannot be compiled unless the package specification has already been compiled. You can create a specification without a body- but you cannot create a body without a specification.

May be wrapped to hide details of the code. Wrap is a stand-alone program that obfuscates PL SQL source code so that you can deliver PL SQL applications without exposing your source code. For more information about the use of wrap, see the PL/SQL Packages and Types Reference.
