NEW QUESTION: 2

The catch clause argument is always of type_____.

- A.** Error
- B.** Exception
- C.** Throwable

- D. RuntimeException
- E. CheckedException
- F. Exception but NOT including RuntimeException

Answer: C

Explanation:

Because all exceptions in Java are the sub-class of `java.lang.Exception` class, you can have a single catch block that catches an exception of type `Exception` only. Hence the compiler is fooled into thinking that this block can handle any exception.

See the following example:

```
try
{
// ...
}
catch(Exception ex)
{
// Exception handling code for ANY exception
}
```

You can also use the `java.lang.Throwable` class here, since `Throwable` is the parent class for the application-specific `Exception` classes. However, this is discouraged in Java programming circles. This is because `Throwable` happens to also be the parent class for the non-application specific `Error` classes which are not meant to be handled explicitly as they are catered for by the JVM itself.

Note: The `Throwable` class is the superclass of all errors and exceptions in the Java language. Only objects that are instances of this class (or one of its subclasses) are thrown by the Java Virtual Machine or can be thrown by the Java `throw` statement.

A `Throwable` contains a snapshot of the execution stack of its thread at the time it was created. It can also contain a message string that gives more information about the error.
