A. Option A
B. Option F
C. Option C
D. Option E
E. Option D
F. Option B
Answer: A,D,E
Explanation:
Explanation
+ IPSec Transport mode is used for end-to-end communications, for example, for communication between a
client and a server or between a workstation and a gateway (if the gateway is being treated as a host). A good
example would be an encrypted Telnet or Remote Desktop session from a workstation to a server. + IPsec
supports two encryption modes: Transport mode and Tunnel mode. Transport mode encrypts only the data
portion (payload) of each packet and leaves the packet header untouched. Transport mode is applicable to
either gateway or host implementations, and provides protection for upper layer protocols as well as selected
IP header fields.

IPsecPG1.html
Generic Routing Encapsulation (GRE) is often deployed with IPsec for several reasons, including

the
following:
+ IPsec Direct Encapsulation supports unicast IP only. If network layer protocols other than IP are to be
supported, an IP encapsulation method must be chosen so that those protocols can be transported in IP packets.
+ IPmc is not supported with IPsec Direct Encapsulation. IPsec was created to be a security protocol between
two and only two devices, so a service such as multicast is problematic. An IPsec peer encrypts a packet so
that only one other IPsec peer can successfully perform the de-encryption. IPmc is not compatible with this
mode of operation.
