NEW QUESTION: 1
Jane, the security administrator, sets up a new AP but realizes too many outsiders are able to connect to that AP and gain unauthorized access. Which of the following would be the BEST way to mitigate this issue and still provide coverage where needed? (Select TWO).
A. Disable the wired ports
B. Use channels 1, 4 and 7 only
C. Disable SSID broadcast
D. Switch from 802.11a to 802.11b
E. Enable MAC filtering
Answer: C,E
Explanation:
Explanation: Network administrators may choose to disable SSID broadcast to hide their network from unauthorized personnel. However, the SSID is still needed to direct packets to and from the base station, so it's a discoverable value using a wireless packet sniffer.
Thus, the SSID should be disabled if the network isn't for public use.
A MAC filter is a list of authorized wireless client interface MAC addresses that is used by a WAP to block access to all unauthorized devices.

NEW QUESTION: 2
In multiple organization access control-enabled environment you search for orders with the following criteria:
-The operating field is null -A specific value is entered for the transaction type field
Which statement best describes the above mentioned search criteria?
A. It will find orders across all operating units, which are accessible under the responsibility used by the application users.
B. It will find orders across all the operating units.
C. It will find orders across all the operating units for which the specific transactions types have been defined.
D. The scenario is not a valid one considering the release 12 functionality.
E. It will find orders across all operating units, which are accessible under the responsibility used also across all the accessible operating units for which the specific transaction type has

been set up.
Answer: E

NEW QUESTION: 3
You plan to deploy Exchange Server 2016 to a new server. The server will host 1,000 mailboxes.
You need to identify whether the new server has the required disk throughput and speed.
Which two tools should you use? Each correct answer presents part of the solution.
NOTE: Each correct selection is worth one point.
A. the Exchange Server Role Requirements Calculator
B. Jetstress
C. Isinteg
D. LoadGen
E. the Exchange Server Best Practices Analyzer Tool
Answer: B,D
Explanation:
Explanation/Reference:
Explanation:
To determine how many Exchange servers are required to manage user load, use the following capacity
planning tools:
Microsoft Exchange Jetstress

Microsoft Exchange Load Generator

Note:
The Jetstress tool is designed to simulate Exchange I/O at the database level by interacting directly with
the database technology of the Extensible Storage Engine (ESE), also known as Jet, that Exchange is built
on. Jetstress can be configured to test the maximum I/O throughput available to your disk subsystem
within the required performance constraints of Exchange, or it can accept a desired profile of user count
and I/Os per second per user and validate that the disk subsystem is capable of maintaining an acceptable
level of performance with such a profile. Jetstress testing can be used to validate storage reliability and
performance prior to the deployment of Exchange servers. You should run Jetstress if you are concerned
about your storage subsystem performance or if you need to determine a system's I/O capacity.
The Load Generator (LoadGen) tool is designed to produce a simulated client workload against a test
Exchange deployment. This workload can be used to evaluate how Exchange performs, and can also be
used to analyze the effect of various configuration changes on Exchange behavior and performance while
the system is under load
Use the output from these tests in the following ways:
Validate deployments

Calculate the client computer response time for the server configuration under client load

Estimate the number of users per server

Identify bottlenecks on the server
