NEW QUESTION: 1

- A. Option A
- B. Option C
- C. Option B
- D. Option D

Answer: A

Explanation:

Explanation

Scenario:

A stored procedure named USP_5 changes data in multiple databases. Security checks are performed each time USP_5 accesses a database.

- Cross-database ownership chaining occurs when a procedure in one database depends on objects in another database. A cross-database ownership chain works in the same way as ownership chaining within a single database, except that an unbroken ownership chain requires that all the object owners are mapped to the same login account. If the source object in the source database and the target objects in the target databases are owned by the same login account, SQL Server does not check permissions on the target objects.

NEW QUESTION: 2

- B. 20.0.0.132
- C. 20.0.0.255
- D. 20.0.0.122

Answer: C

Explanation:

When the user creates a subnet in VPC, he specifies the CIDR block for the subnet. In this case the user has created a VPC with the CIDR block 20.0.0.0/24, which supports 256 IP addresses (20.0.0.0 to 20.0.0.255.. The public subnet will have IP addresses between 20.0.0.0-20.0.0.127 and the private subnet will have IP addresses between 20.0.0.128-20.0.0.255. AWS reserves the first four IP addresses and the last IP address in each subnet's CIDR block. These are not available for the user to use. Thus, the instance cannot have an IP address of 20.0.0.255
