A cloud architect is tasked with providing a design for integration with a third-party system. The following requirements have been identified:

- \* When a user requests a virtual machine, vRealize Automation should pass the user selected application name with its key to the third-party system.
- \* The application list could be updated weekly following the architecture approval meeting. It currently has 250 items.
- \* Impacts to the vRealize Automation virtual machine request screen's performance should be minimized.

What would be the best solution to meet these requirements?

- A. Design a schedule vRealize Orchestrator (vRO) workflow to read values from the third-party system and store in vRO, Create a vRO action to return application values stored in vRO as "Properties", Create a Display drop-down custom property with external values and map it to the vRO action.
- B. Create a vRO action to return application values as "ArrayString" by reading from the

third-party system dynamically, Create a display drop-down custom property with external values and map it to the vRO action.

**C.** Create a Display drop-down custom property with external values and provide AJAX call information to the third-party system.

**D.** Design a schedule vRO workflow to read values from the third-party and store in vRO, Create a vRO action to return application values stored in vRO as "ArrayString", Create a Display drop-down custom property with external values and map it to the vRO action.

どのAzureサービスを使用する必要がありますか？

**A.** Azure Event Hub

**B.** Azureサービスバス

**C.** Azureリレー

**D.** Azureイベントグリッド

**Answer: A**

Explanation:

Explanation

Azure Event Hubs is a big data pipeline. It facilitates the capture, retention, and replay of telemetry and event stream data. The data can come from many concurrent sources. Event Hubs allows telemetry and event data to be made available to a variety of stream-processing infrastructures and analytics services. It is available either as data streams or bundled event batches. This service provides a single solution that enables rapid data retrieval for real-time processing as well as repeated replay of stored raw data. It can capture the streaming data into a file for processing and analysis.

It has the following characteristics:

\* low latency

\* capable of receiving and processing millions of events per second

\* at least once delivery

Note: Comparison of services

### **NEW QUESTION: 4**

A user has enabled termination protection on an EC2 instance. The user has also set Instance initiated

shutdown behavior to terminate. When the user shuts down the instance from the OS, what will happen?

**A.** It will terminate the instance

**B.** The OS will shutdown but the instance will not be terminated due to protection

C. It will not allow the user to shutdown the instance from the OS

D. It is not possible to set the termination protection when an Instance initiated shutdown is set to

terminate

**Answer: A**

Explanation:

It is always possible that someone can terminate an EC2 instance using the Amazon EC2 console,

command line interface or API by mistake. If the admin wants to prevent the instance from being

accidentally terminated, he can enable termination protection for that instance. The user can also setup

shutdown behavior for an EBS backed instance to guide the instance on what should be done when he

initiates shutdown from the OS using Instance initiated shutdown behaviour. If the instance initiated

behavior is set to terminate and the user shuts off the OS even though termination protection is enabled, it

will still terminate the instance.
