DECLARE @durationFilter bigint = 100  
DECLARE @databaseId int;  
SELECT @databaseId = DB_ID('MyDatabase');
```

Answer:

Explanation:

Explanation

The following system stored procedures are used to define and manage traces:

- * sp_trace_create is used to define a trace and specify an output file location as well as other options that I'll cover in the coming pages. This stored procedure returns a handle to the created trace, in the form of an integer trace ID.
- * sp_trace_setevent is used to add event/column combinations to traces based on the trace ID, as well as to remove them, if necessary, from traces in which they have already been defined.
- * sp_trace_setfilter is used to define event filters based on trace columns.
- * sp_trace_setstatus is called to turn on a trace, to stop a trace, and to delete a trace definition once you're done with it. Traces can be started and stopped multiple times over their lifespan.
