By using our OC-11 exam guide, a series of benefits will come along in your life.

NEW QUESTION: 1

Which two statements are true about index full scans?

- A.** An index fast full scan reads the whole index from the lowest value to the higher value.
- B.** Index nodes are not retrieved in the index order, and there fore the nodes are not in sequence.
- C.** An index fast full scan reads the index block by block.
- D.** An index fast full scan multi block I/O to read the index structure in its entirety.

Answer: B,D

Explanation:

A: To speed table and index block access, Oracle uses the `db_file_multiblock_read_count` parameter (which defaults to 8) to aid in getting full-table scan and full-index scan data blocks into the data buffer cache as fast as possible.

B: The index nodes are not retrieved in index order, the rows will not be sequenced.

Note: there are some requirements for Oracle to invoke the fast full-index scan. - All of the columns required must be specified in the index. That is, all columns in the select and where clauses must exist in the index. - The query returns more than 10 percent of the rows within the index. This 10 percent figure depends on the degree of multi-block reads and the degree of parallelism. - You are counting the number of rows in a table that meet a specific criterion. The fast full-index scan is almost always used for `count(*)` operations.

Reference: index fast full scan tips An application supplied by a new vendor is being deployed and the SQL statements have plan baselines provided by the supplier. The plans have been loaded from a SQL tuning set. You require the optimizer to use these baselines, but allow better plans to used, should any be created.

NEW QUESTION: 2

- A. Option A
- B. Option C
- C. Option D
